

# The Case for Argon

## For a Stronger and Cleaner Weld!

### What Does Argon Do?

Argon is used as a shielding gas to protect your welding against elements in the atmosphere, like oxygen, nitrogen, and hydrogen. These elements react with your welding, creating porosity and increased weld spatter. Argon shields your welding while improving weld penetration (a stronger connection, better filler wire transfer, and better weld appearance (less soot!).

### Choose Two Conveniently Sized Tanks!

For your studio, Sunstone's 50 scf tank can provide approximately 12,000 welds with premium argon. For permanent jewelry pop-up events, the Argon Mini is small enough to fit in your purse yet still delivers about 650 welds! Sunstone's premium argon is 99.996% pure (Argon 4.6), the *creme de la creme* of argon!

Sunstone's 50cfs argon tank is only 27" tall and will fit under most benches and tables.

The Argon Mini is petite at less than 12" tall and will fit in a backpack, bag, or even your back pocket!
